Topic	Context	What Happened	Takeaway
Manufacturing Overview	First Job Out of College Joined a team that needed support for the production of a big space program (JWST) And our production line was primarily in a cleanroom environment	The official name of the product was called a Integrated Dewar Cooler Assembly which is a fancy term for an infrared sensor and I'm happy to go into the weeds if you want me to But basically it was a huge program for the site and we were only building a few units maybe like 10 in total but my role was to know everything that happened to each unit and make sure it went through the production line smoothly.	And looking back on it, it was honestly one of the best jobs I could've gotten out of college because while there were some stressful moments of being so visible, I was able to learn so much about product development and see a product go through different stages of its build whether its checking the quality of our incoming parts from our suppliers to validate our product through testing, I think my biggest takeaway from that Manufacturing Engr role was getting to see the entire product lifecycle.
Materials & Process Overview	I was in that Manufacturing Eng role for a while then I wanted to build more technical depth [wearing many hats to wearing one hat really well] and I noticed a lot of the Process Engineers did that and so I transitioned to a Process Engineering role - still working on the same	And during my time as Process Engineer, I was responsible for a couple of tasks: Automation Die Bonder Laser Welder Metrology & Precision Alignment Purchasing Capital Equipment Material Testing Statistical Process Control	One of the biggest takeaways from Process Engineering, I was able to take ownership of a process and dive deep into a specific part of the build. Programs relied on Process Engineers to understand our capability - whether something was achievable and

	product but through a different lens	Vibration Testing Thermal Cycling	repeatable And I think that was an important part of industry for me to see because I've learned Common Theme across engineering is Variability and finding ways not only to reduce variability but also to control it – so that you can predict and plan for the unexpected and gives engineers a better understanding of your design intent and how likely we can achieve it. [I'd imagine Materials Testing would be something similar]
Tooling Design Engineer (Revisit)	(Quarter Life crisis) Wanted to see a new product Wanted to live in a different place Wanted to move out of the Infrared Hub I was getting to comfortable and wanted to be uncomfortable before it felt too late	Culture Shock: Cleanroom to Largest Building in the world Learning a new product & industry of aviation 777 Empennage	Common Themes of Metrology / Alignment Supplier Quality Production vs Design clashes New Pride of working on products
Why BD	Relocating with NK - Final Placement, Moving to start our next chapter	Interested in growing in a new industry I feel like I've heard great things with BD Culture in terms of being valued and	Taking Pride in my work and being reminded of my impact in everyday life There's a reason it's

		community contribution	hard and make sure things are done right
Why this role? (Material Testing)	Speaking with Anita, she gave me a preview of some of the team challenges: PFAS & Material Shelf Life	Aligns with my interests of being hands on with design & analysis	Growth within the Digital Engineering team and company - Simulation Team
Industry Transition Gameplan	It wouldn't be the first time I joined a new industry	Requirements Drivers Toolbelt & Resources Networks & Allies	Based on my conversations with Anita, there seems to be parallels between Aerospace & MedTech
Materials & Testing Experience - Examples throughout my career	I thought about this and applying to this role made me realize how much material and testing have been involved in my career		
Nonlinear Material & Plastics	Typical Ashby Chart, most of my experience has been the metals/cermaics world, I haven't really had to get too involved	Definitely an area of growth but I feel like I've learned about plastics in school My experience in industry has always made me ask the Why's in material - wouldnt be the first time I've dealt with unfamiliar materials (HgCdTe)	While I might not have extensive experience with non linear material like plastics, I feel I have a good foundation of material knowledge and transferrable skills of material selection from metals/ceramics that Previous experience can transfer over
Design of Experiment Walkthrough	Example Story?		

Really strong foundation — this is your best story for the material testing question because it hits almost every dimension BD cares about. Here's how I'd polish and structure it for a verbal answer:
The core problem with the draft as-is:

It's organized as a list of everything you did rather than a narrative that builds to a point. For a phone screen, you want a story arc — context, challenge, what you did, what you learned — not a feature list. Jason and Marcus need to follow it in real time without slides or bullet points.
Suggested verbal structure using STAR:
Situation (15 seconds): Set the context quickly.
"At Raytheon I owned the laser welding process end-to-end — this was the critical sealing operation for infrared camera housings that had to maintain integrity at extremely cold operating temperatures. If the weld failed, the product failed."
Task (10 seconds): What your ownership actually meant.
"My responsibility covered everything from developing weld recipes for new programs to monitoring process health, dispositioning defects, and qualifying new materials."
Action (60 seconds): This is where you spend most of your time — pick your two or three strongest examples rather than listing everything.
"On the material side, I did a significant amount of weld compatibility testing across different material combinations — evaluating surface finish, composition, and how those variables affected joint integrity. I also ran coupon testing on a regular cadence to monitor machine health, and bimonthly recipe verification on production samples to confirm process stability. When we had a specific customer-driven requirement, I brought in X-ray diffraction as a non-destructive evaluation method to characterize weld quality without destroying hardware. And throughout all of this I was tracking KPIs, running SPC and Cp/Cpk analysis to catch drift early and keep the process in control."
Result / Takeaway (15 seconds): Land the lesson.
"What that experience gave me was a deep understanding of how to own a process scientifically — not just run tests, but design the right tests, interpret the data, and translate it into decisions. That's the same instinct I'd bring to material characterization work at BD."
A few specific tips:
The XRD story is a hidden gem — non-destructive evaluation for a customer-driven requirement maps directly to BD's experimental method development work. Don't bury it in a list; give it one sentence of emphasis.
Drop the parenthetical about the email thread with Albert Linder — that's a note to yourself, not something to say out loud.
The adhesives and shear testing detail is worth keeping in because it shows polymer-adjacent materials experience, which is relevant to BD's polymer-heavy testing environment.
The helium leak check is a nice detail that shows product-level testing exposure beyond just coupons — keep it as a one-line mention.

Absolutely — here's the full polished version with the weld compatibility section woven in naturally:

"At Raytheon I owned the laser welding process end-to-end — this was the critical sealing operation for infrared camera housings that had to maintain hermeticity at extremely cold operating temperatures. If the weld failed, the product failed, so there was no margin for process ambiguity.
My ownership covered everything from developing weld recipes for new programs to monitoring process health, dispositioning defects, and qualifying materials. On the materials side, I developed a working knowledge of weld compatibility across the material combinations commonly seen in aerospace and space hardware — aluminum alloys, stainless steels, titanium, and kovar, each of which behaves differently under a laser heat source in terms of absorptivity, thermal conductivity, and susceptibility to cracking or porosity. Surface finish and material composition were variables I actively characterized because even small deviations could affect joint integrity at the weld interface. I also worked with adhesives and ran shear testing to evaluate bond strength in complementary joining applications.

For process monitoring I ran coupon testing on a regular cadence to track machine health, and bimonthly recipe verification on production samples to confirm process stability across programs. When a customer required non-destructive characterization of weld quality, I brought in X-ray diffraction — which gave us internal joint information without destroying hardware. For final product verification we used helium leak testing to confirm hermetic seal integrity.
Throughout all of this I was tracking KPIs, running SPC and Cp/Cpk analysis to catch process drift early, and translating that data into actionable decisions for the program team. What that experience gave me was a deep understanding of how to own a process scientifically — not just execute tests, but design the right tests, interpret the data rigorously, and connect the results to engineering decisions. That's exactly the instinct I'd bring to material characterization work at BD."

A couple of notes on the weld compatibility addition specifically:
Naming the actual material families — aluminum alloys, stainless steels, titanium, kovar — is important because it shows depth rather than just claiming "experience with different materials." Kovar in particular is a credibility signal for anyone with aerospace or hermetic packaging background.
The three material variables you called out — absorptivity, thermal conductivity, and cracking/porosity susceptibility — give the answer just enough technical texture without going so deep that you lose a recruiter on a phone screen. If Marcus asks a follow-up in the technical interview, you have plenty more to go deeper on.

Weld Compatibility Matrix:

Here's your interactive weld compatibility matrix. Here's what's included:
7 aerospace metals covered: Aluminum alloys, Stainless Steel, Titanium, Kovar, Inconel, Copper alloys, and Mild Steel — the core material families you'd encounter in aerospace, space, and defense hardware.
Four compatibility ratings: Excellent, Good, Fair, and Poor — color coded green through red for instant visual scanning.
Interactive detail panel: Hover or tap any cell to see engineering notes for that specific metal pair — including the metallurgical reason for the compatibility rating, relevant failure modes (hot cracking, intermetallic formation, CTE mismatch), and aerospace application context.
A few notable pairs to know for your interview:

- SS + Kovar = Excellent — the standard hermetic sealing combination for aerospace electronics packages, which maps directly to your Raytheon work
- Al + SS = Poor — thermal expansion mismatch and hot cracking risk, commonly asked about in welding discussions
- Ti + Ti = Excellent — highly weldable but requires strict argon atmosphere control
- Cu + Cu = Challenging — high reflectivity is a known laser welding difficulty, relevant if asked about process limitations

Additive Manufacturing	Prototyping - fixtures, tools, products before full scale production	3D Printing Materials - TPU, PLA, PETG The world of 3D Printing really taking off

🔹 **Behavioral Questions (teamwork, communication, problem-solving)**

- Tell me about yourself. (Summary)
- Describe a challenging engineering problem you worked on. (Laser Weld Capital Project)
- Tell me about a time you failed or made a mistake. What did you learn? (Rushed Friday Job)
- Describe a time you worked on a team with conflicting opinions. (Laser Weld NDT Project)
- How do you handle tight deadlines or multiple projects? (Grad School & Working)
- Give an example of when you had to explain a technical concept to a non-technical audience. (Explaining Engineering with Sports Analogies)
- Tell me about a time you took initiative or led a project. (Laser Weld Capital Project
- How do you handle feedback or criticism? (Check In's)

🔹 **Situational Questions (logic, ethics, communication, and practicality) "what would you do if…" questions to test judgment and decision-making.**

- What would you do if your design didn't meet safety requirements late in the project?
  - Understand the problem
  - Transparency & Communication - Face the tough conversation early before it becomes something bigger

    - Work with various departments to identify risks & create mitigation plans
- How would you handle discovering an error in your calculations after submission?
    - Understand the problem
    - Transparency & Communication - Face the tough conversation early before it becomes something bigger
    - Work with various departments to identify risks & create mitigation plans
- If a teammate isn't pulling their weight, how would you handle it?
    - Understand the problem
    - Transparency & Communication - Face the tough conversation early before it becomes something bigger
    - Work with various departments to identify risks & create mitigation plans
    - Escalate as needed
- How would you prioritize tasks when multiple projects are due at the same time?
    - Understand the problem
    - Transparency & Communication - Face the tough conversation early before it becomes something bigger
    - Work with various departments to identify risks & create mitigation plans
- What would you do if manufacturing tells you your design is too expensive to produce?
    - Understand the problem
    - Transparency & Communication - Face the tough conversation early before it becomes something bigger
    - Work with various departments to identify risks & create mitigation plans
    - Bring in different perspectives
- How would you respond if your manager disagreed with your technical recommendation?
    - Understand the problem
    - Transparency & Communication - Face the tough conversation early before it becomes something bigger
    - Work with various departments to identify risks & create mitigation plans

---

🔹 **Technical Questions**

- Focal Plane Array ELI5
- Laser Weld ELI5
- Airplane Manufacturing ELI5

⚙️ **Mechanical Fundamentals**

- Explain stress vs. strain.
- What is Young's modulus?
- Difference between ductile and brittle materials?
- What causes fatigue failure?
- What is factor of safety and why is it important?

- Explain torsion in shafts.

🧱 **Materials**

- How do you select materials for a specific application?
- Difference between steel, aluminum, and cast iron?
- What is heat treatment?
- What is creep?
- What are composites and where are they used?

🛠️ **Manufacturing & Design**

- Difference between machining, casting, forging, and additive manufacturing.
- What are GD&T symbols and why are they used?
- Explain tolerance and fit (clearance, interference, transition).
- What CAD tools have you used? (SolidWorks, CATIA, Inventor, etc.)
- How do you design for manufacturability (DFM)?

🌡️ **Thermo / Fluids (if relevant)**

- Difference between conduction, convection, and radiation.
- What is Reynolds number?
- Explain the first law of thermodynamics.
- Difference between laminar and turbulent flow?
- What is efficiency vs. effectiveness?

💻 **Analysis & Tools**

- Have you used FEA or CFD? Explain your process.
- How do you validate simulation results?
- Experience with MATLAB, Python, or Excel?
- How do you approach troubleshooting a mechanical system?

🔹 **Bonus "Sneaky" Questions**

These blend everything together:

- Walk me through one of your projects from concept to completion.
- What's your favorite engineering project and why?
- What would you improve in this design? *(they may show you a part)*
- How do you ensure safety and compliance in your designs?

🔹 **How to Prep Smart**

- Review **core fundamentals** (not obscure equations).
- Be ready to **talk through your thinking**, not just answers.

- Prepare **2–3 strong project stories** you can reuse.
- Know the company's products and how mechanical engineering applies to them.

Approach: Design an experimental plan for an ambiguous or poorly defined problem?

1) **Clarify the engineering question you're trying to answer**
2) **Identify what physical measurements will answer it**
3) **Define variables, controls, and acceptance criteria upfront**
4) **Design for repeatability and statistical confidence**
5) **Build in checkpoints to adapt if early data suggests a different approach.**

Design of Experiment example:
Impact of Welding on Z height Shrinkage

1) **Clarify the engineering question you're trying to answer**

What is the magnitude of Z-height shrinkage caused by the welding process?
Is shrinkage consistent across parts or dependent on process variables?
Which welding parameters most strongly influence vertical distortion?

2) **Identify what physical measurements will answer it**

Pre-weld baseline Z-height measurement of the part or assembly.
Post-weld Z-height measurement at defined datum locations.
Shrinkage = (Pre-weld Z height – Post-weld Z height).
Measure multiple points across the part to capture warping or non-uniform distortion.
Record:

- **Weld current / power**
- **Travel speed**
- **Heat input**
- **Weld sequence**

Use a repeatable measurement system (e.g., CMM, laser scanner, or height gauge).

3) **Define variables, controls, and acceptance criteria upfront**

Weld Input & Speed
Material & Thickness
Operator
Response Variable: Z- Height Shrinkage

4) Design for repeatability and statistical confidence

Run multiple replicates per condition (e.g., n ≥ 3–5).
Randomize test order to reduce systematic bias.
Use a factorial DOE or fractional factorial design to isolate parameter effects.

Evaluate:

Mean shrinkage
Standard deviation
Process capability vs tolerance

5) Build in checkpoints to adapt if early data suggests a different approach.

Root Cause Analysis Approach:

1) Crime Scene: Collect Event Data like a Crime Scene
    a) Pictures, Testimonials, Documentation
    b) My memory is better when I have notes
    c) Was anything abnormal about the process?
2) Process of Elimination: Come up with a list of potential root causes and slowly use data for process of elimination
3) Investigate: Use resources (Historical Records, Standards, internal & external expertise, Fault Tree Analysis, Fishbone Diagram) to narrow down root cause
4) Distinguish Root Cause vs Contributing Factors
    a) Root Cause – fundamental failure that allowed the issues
    b) Contributing Factors – things that worsened or enabled it
    c) Trigger Event – what actually initiated the incident
5) Validate Root Cause & Corrective & Preventative Actions (CAPA)
6)

—------

Process Quality Level 4: PQ4 (Process Capability Improvement/Optimization)
Item No. 22: Design of Experiments conducted as required for improvement and for new processes

Due to favorable historical yields for the Laser Weld Process, there has been no immediate need to conduct a Design of Experiments to improve the process.

If dimensional requirements continue to tighten, a possible relevant DOE in the future

could be to check by how much various dimensions differ between 1) unit setup in tool 2) dimensions after tac welding 3) dimensions after seem welding. Historically, on Header to Coldfinger welds, unit tends to “shrink” about .002” between tac and seam weld.

Story Arsenal
Table: Type // Common Phrases Buzzwords // Story
Mentally confirm I have:
• ☐ One signature technical win // BL0
• ☐ One failure or recovery // MRSI
• ☐ One tradeoff decision // BI0
• ☐ One cross-functional conflict // Goldwing
• ☐ One process improvement // Capital Project
• ☐ One leadership / ownership moment // Capital Project

Type	Cue	Story
Technical win		Laser Weld NDT or Capital Project
Failure or Recovery	Tell me about a challenge “something that didn’t go as planned”	Goldwing with V
Tradeoff Decision	How do you make decisions? How do you balance X vs Y?	Smart Scopes vs Ultras
Cross Functional Conflict	How do you work with others? “Tell me about a disagreement”	Laser Weld Non Destructive Testing Process with New Customer
Process Improvement		PCU Safety Project
Leadership / Ownership	“Have you led?” “How do you handle responsibility?”	Laser Weld Capital Project • Being the technical authority • Owning qualification

		or release • Mentoring technicians or junior engineers
High-pressure situation	• Production stop • Flight hardware issue • Late discovery before release	MRSI Rushed Decision vs Right Decision Slowing down time
Learning Growth Story	"What are you working on?" "What would you do differently?"	Prioritizing Schedule over relationships High-Pressure Situation of getting something done on a Friday afternoon to meet schedule pressure

Common Themes:

- Disconnect between Engineering & Manufacturing
    - Engineering lives in the Model world while Manufacturing lives in the Physical World
    - Best Engineers bridge that gap and understand from both sides
        - Mechanical Engineer that has never machined anything
        - Technician that doesn't know what indexing is
- Constant Tradeoff between Cost/Schedule/Quality
    - Different departments have different objectives and focuses
- Finding ways to reduce variation & predict behavior
    - (Part Tolerances, Process Control, Command Media)
- Working with People can be the best and worst thing
    - Don't do things alone / Lean on other's expertise from all levels / Understand patterns and trends

Next Steps (3/8):

- Polish Story Arsenals
- Practice Cadence of being in front of a camera (Doesn't have to be perfect)
- Practice w/ Jooble
- Flashcards
- Physically Write Down Me, Them, Us, & Reflect
- One Pagers
- Polish Guides to use / reference day of interview

Life Stuff:

- Laundry
- Run
- Cook
- Early Bed Time
