What do I want my message to be?
Chapter Overviews
- My Takeaways from each chapter
- My Unique experience – seeing a product from different angles and perspectives
- Working with different products and environments

BD Specific
- Moving with girlfriend
- Aligned Company Mission & Values
- Balance of hands on & design
- Transferable skills to the role
- Growth of working in a new environment & new materials & industry challenges

Anticipated Questions
- Industry Transition – My response to this would be that it wouldn't be the first time

Material & Testing Experience
- Laser Weld
    - Tensile Testing
    -
- Supplement
    - Vibration Testing
    - Thermal Cycle Testing

Next Steps:
- Laser Weld Overview Touch Up

Laser Weld Role:

Context:

- Process Engineer for Laser Weld
- Laser Welding is a portion of the build that seals the housing so the product can perform at cold operating temperatures

What:

- Process Monitoring / Statistical Process Control
- Dispositioning Defects and Root Cause Analysis with Program
- Develop Weld Recipes for new programs & optimizing welds
- Purchasing Capital Equipment
- Materials
    - Different types of Weld Compatibility
    - Surface Finish Testing – Material Composition (If I still have the email thread with Albert Linder)
    - Materials & Process Lab Testing Equipment (Adhesives, Shear Testing
- Testing
    - Coupon Testing – Health of our machine
    - Sample Testing – Bimonthly Program Recipe Verification
    - Product Testing – Helium Leak check
    - Strength Testing – Tensile Testing
    - Non Destructive Testing Case – XRD – X-Ray Diffraction for a customer
    - Rework: Cut-open Procedure

Takeaway:

- Laser Welding Process taught me a lot about diving deep into a process and understanding
    - KPIs – Key Performance Indicators
    - Cpk & SPC – Working with data

- Being responsible for a

Remaining Actions:

- Determine ISO Standards that were used and applied
- IPG Laser Welder Specifics (Laser Power / Fiber Optics / Argon Shielding)

Design of Experiment Walkthrough

- **Define:** Identify the experimental purpose, response(s), and factor(s).
- **Model:** Propose or specify an initial statistical model.
- **Design:** Generate and evaluate an experimental design that can support the initial statistical model.
- **Conduct:** Execute runs and collect data for each row (run) in the design.
- **Analyze:** Fit a statistical model to the experimental data to answer your research questions.
- **Predict:** Use your confirmed statistical model to predict future values of the responses.

Capital Laser Weld Project

- Context:
  - Our site had two laser welding machines: One was a modern IPG Welder bought in 2015. And the other was built in the 1990's basically on life support and it was getting more issues with calibration and parts were becoming obsolete. The machine was a risk to the factory if it were to go down, it would create a single point failure.
- My Role:
  - My role as the Process Engineer for Laser Welding was to essentially spearhead the decision to purchase a Laser Welding machine for the site
  - This included providing justification for a new machine, working with the supplier for a new machine, coordinating with factory and facilities to schedule an installation plan, notifying the affected programs and creating productions, presenting to PCCB,
- Key decision:
  - We decided to go with the same company as our existing welder
- Result:
  - It took a few months of rigorous work but we eventually got the new laser welder in. There was a minor hiccup about
- Lesson:
  - What I thought was going to be a relatively simple process of copy and paste turned to be one of the most extensive projects mainly because it was a capital equipment requires more scrutiny and justification for purchase & half a million-dollar equipment
- That's it

Plastics Video

-mer (unit) → Polymer

Atom Structure of different Polymers: Carbon, Hydrogen, + Fluorine/

Two Polymers with same chemical structure could have two different

Polymerization – Process that turns monomers into polymers
    Different plastics use different resources
PLA: lactic acid
    Copolymer – using different monomers
        ABS – A = , B = , S =

Two types of Polymerization: Addition & Condensation
    Addition: Chain Growth Process
    Condensation: Two different types of monomers
        Step Growth Process

Linear Arrangement – Weak
    HDPE, PVC
Branched Arrangement –
    LDPE
Cross-Linked Arrangement – Rigid 3D Network
    Vulcanized Rubber

Thermoplastics (Polymers that soften or melt when heated)
Widely used
    Can be heated and reshaped for injection molding
    Can't perform at high temperatures

Thermosets
Cross-Linked
Do not melt
Used in polymer fibers in composites
Legos

Crystallinity
Unlike Metals, Plastics are Semi-crystalline
    Regions of Amorphous Regions & Crystalline Patterns

Layers of Order & Jumbled

Linear = High Crystallinity
HDPE, PVC
Stronger, Stiffer, Higher Melting Point
Branched = Low Crystallinity
LDPE, PEEK
Cross-Linked = No Crystallinity
PMMA (Plexiglass)
Will be transparent because Crystallinity scatters light so amorphous is more transparent

*Crystallinity explains different material properties despite same chemical structure of repeating mer unit

Ashby Chart of Stiffness & Density:
Polymers:
Advantage:
Lightweight
Thermal & Electrical Insulation
Corrosion Resistance
Low Cost
Disadvantage: Low Strength & Stiffness

Elastomers:
Latex – Natural Rubber
Weak Interconnections with polymers allow it to be stretchy and deform

Vulcanization: Can improve performance
Heating Rubber with sulfur which forms cross-links between polymer chains
Creates anchor points which increases strengths
But tricky balance because if too many anchor points will become like a thermoset and brittle and not be able to stretch as desired
Vulcanization common in Elastomers like Gaskets & Tires to enhance strength & durability

Stress Strain Curve Analysis
Brittle: (Epoxy Resins, PMMA, PLA)
Ductile: (PE, PP, Nylon)
Elastomers: Different Curve

Ductile Polymers
Necking isn't like Metals

Experiences Cold Drawing at Necking which momentarily aligns fibers/polymer chains and actually strengthens the material

Kevlar – Uses Cold Drawing Behavior to intentionally drawn to create material with high tensile strength along the fiber axis

Brittle Polymers
Crazing - tiny voids form within the polymer just before fracture with fibrils
Unlike cracks in metal
Crazing can be an indicator of catastrophic failures soon to happen (unlike metals)

Material Properties with Temperatures

- Low Temperature: Stiffness is high & stable
  - Glass Transition Temperature: hard to soft transition temperature
- Increase Temperature: Stiffness decreases → Soft Compliant Material
  - Melting Temperature
- Liquid: No Stiffness

Amorphous Polymers – no well-defined melting points
Thermosets – don't have melting point at all

Glass Transition Temperature Factors: Anything that restricts polymer chain mobility will increase T_g

- Cross-Linking
- Bulky Side Groups
- Long Entangled Polymer Chains

Plasticizers – additive small molecules that insert themselves between polymer chains to reduce intermolecular forces to reduce Glass Transition Temperature
Plasticizing PVC to be flexible at room temperature used for wire insulation and flexible tubing

Case Study: Challenger Space Shuttle O-rings at colder temperatures became more stiff and improper seal

Viscoelasticity – Behaviour where material behaves partly

<u>The Power of Gold</u>

https://www.garfieldrefining.com/resources/blog/how-is-gold-used-in-space-exploration/

Spacesuits

NASA also uses gold in the construction of spacesuit visors. A very thin layer of gold is applied to the outside of a polycarbonate plastic visor to protect astronauts from the sun's harmful radiation in space.

Gold is ideal because it reflects nearly all infrared light, which can damage the eyes – even though we can't see or feel it. By itself, gold transmits about 60% of visible and ultraviolet (UV) light, so it doesn't provide full protection.

That's where polycarbonate plastic comes in. It blocks most UV light, which can also damage the eyes. Together, the gold coating and polycarbonate visor block harmful infrared and UV rays while still allowing enough visible light through for astronauts to see!

Technical win	Describe a challenging engineering problem you worked on.	**BL0 Project**
Failure or recovery	Tell me about a time you failed or made a mistake. What did you learn?	**MRSI Component**
Cross-functional conflict	Describe a time you worked on a team with conflicting opinions.	**Goldwing**
Tradeoff decision		**BL0 Project**
Process Improvement		**Capital Laser Weld**
Leadership / Ownership		**Capital Laser Weld**

Behavioral

Tell me about yourself.	[Insert Elevator Pitch]
Tell me about a time you failed or made a mistake. What did you learn?	Right is better than being rushed Delegating is better than trying to do it all Done is better than perfect
How do you handle tight deadlines or multiple projects?	
Give an example of when you had to explain a technical concept to a non-technical audience.	
Tell me about a time you took initiative or led a project.	
How do you handle feedback or criticism?	Understanding the bigger picture like the Why Giving a timeline or quantifiable metrics to measure past / future performance

Situational Questions (logic, ethics, communication, and practicality) "what would you do if…" questions to test judgment and decision-making.

What would you do if your design didn't meet safety	Acknowledge → Assess → Act → Communicate → Prevent Recurrence

requirements late in the project?	What they're testing: Ethics, safety mindset, courage under pressure. I'd assess the gap, propose corrective design changes, and evaluate the schedule and cost impact. I'd work with stakeholders to find the safest path forward rather than pushing something that could fail in the field. Example: Safety Project for the PCUs
How would you handle discovering an error in your calculations after submission?	**Integrity & Accountability** "I'd verify the error first, understand its impact, and then notify the appropriate people as soon as possible. I'd explain the mistake, provide corrected calculations, and outline whether it affects the design, safety, or timeline. I believe transparency builds trust, even when it's uncomfortable.
If a teammate isn't pulling their weight, how would you handle it?	**Team Skills & Conflict Management** "I'd start by having a private, respectful conversation to understand if there's a workload, skill, or communication issue. If needed, I'd offer help or clarify expectations. If the issue continued and affected the project, I'd bring it to the team lead with a focus on solutions, not blame." Example: Working with V on Goldwing
How would you prioritize tasks when multiple projects are due at the same time?	**Time Management & Judgement** "I'd prioritize based on deadlines, technical risk, and impact. I'd break tasks into smaller deliverables, identify critical paths, and communicate early if conflicts exist. If necessary, I'd align priorities with my manager so expectations are clear." Example: Tooling Projects // Process
What would you do if manufacturing tells you your design is too expensive to produce?	**DFM Mindset & Collaboration** I'd work with manufacturing to understand the cost drivers—materials, tolerances, processes—and look for design alternatives that meet performance requirements at lower cost. I see manufacturing feedback as part of optimizing the design, not a roadblock. Propose different solutions with the understanding of different risks
How would you respond if your manager disagreed	**Professionalism & Influence without ego** "I'd make sure I clearly explain my reasoning, data, and assumptions. If my manager still disagreed, I'd listen to their

with your technical recommendation?	perspective and understand their constraints. Ultimately, I'd support the final decision while documenting risks if appropriate." Clearly document the risks

Technical Questions

Bonus "Sneaky" Questions (These blend everything together):

Walk me through one of your projects from concept to completion.	
What's your favorite engineering project and why?	
What would you improve in this design? *(they may show you a part)*	
How do you ensure safety and compliance in your designs?	**Asking for feedback from different perspectives (Bridging the gap between Engineering & Technicians)**
Process Overview	FPA Laser Weld Empennage

Analysis & Tools

Have you used FEA or CFD? Explain your process.	

How do you validate simulation results?	
Experience with MATLAB, Python, or Excel?	**MATLAB – Hexapod System** **Python – UW College** **Excel – Data Export**
How do you approach troubleshooting a mechanical system?	

Materials

How do you select materials for a specific application?	
Difference between steel, aluminum, and cast iron?	
What is heat treatment?	
What is creep?	
What are composites and where are they used?	

Manufacturing & Design

Difference between machining, casting, forging, and additive manufacturing.	
What are GD&T symbols and why are they used?	
Explain tolerance and fit (clearance,	

interference, transition).	
What CAD tools have you used? (SolidWorks, CATIA, Inventor, etc.)	
How do you design for manufacturability (DFM)?	

Mechanical Fundamentals

What is Young's modulus?	
Difference between ductile and brittle materials?	
What causes fatigue failure?	
What is factor of safety and why is it important?	
Explain torsion in shafts.	

Thermo / Fluids (if relevant)

Difference between conduction, convection, and radiation.	
What is Reynolds number?	
Explain the first law of thermodynamics.	
Difference between laminar and turbulent flow?	
What is efficiency vs. effectiveness?
